Task 3: System Analysis and Requirements Gathering

Project Name: Smart Complaint Escalation System

1. Introduction

The Smart Complaint Escalation System is designed to help organizations manage customer complaints in a better and more organized way. It allows customers to submit complaints, follow their status, and receive updates about the progress of their cases.

The system also helps employees assign complaints to the right departments and automatically escalate unresolved complaints to a higher level when they exceed their deadlines.

The main purpose of this system is to reduce delays, improve communication, and make sure that complaints are handled properly.

2. Interview Questions and Answers

The interview aims to understand how complaints are currently handled, what problems employees face, and how a smart system could improve the process.

Interviewee: Customer Service or Complaints Officer

2.1 Open Interview Questions

Question 1: How are complaints currently received and managed in your organization?

Answer:

Most of the time, customers contact us by phone, email, or through the website. We record the complaint and send it to the department responsible for the problem. Sometimes, following up takes time, especially when more than one department is involved.

Question 2: What are the main problems you face when handling complaints?

Answer:

The biggest problem is that some complaints take too long to solve. We also receive many complaints at the same time, so it can be difficult to keep track of everything and make sure nothing is missed.

Question 3: How do you decide when a complaint should be escalated to a higher level?

Answer:

Usually, if we cannot solve the problem ourselves or the customer keeps contacting us without getting a solution, we send the complaint to a supervisor. Sometimes this happens late because we are busy with other complaints.

Question 4: What difficulties do you experience when tracking complaints and their resolution time?

Answer:

Sometimes I have to contact another employee just to know what happened with a complaint. If the person responsible is busy or does not respond quickly, it becomes harder to update the customer.

Question 5: What improvements would you suggest for a Smart Complaint Escalation System?

Answer:

I think it would help if all complaints were saved in one place and we could see their status easily. It would also be useful if the system reminded us about delayed complaints and automatically sent them to a supervisor when necessary.

2.2 Closed Interview Questions

Question 6: Does your organization use a computerized system to manage complaints?

Answer: Yes, but some follow-up tasks are still done manually.

Question 7: Are complaints assigned to specific employees or departments?

Answer: Yes, each complaint is usually sent to the department responsible for it.

Question 8: Does every complaint have a clearly defined resolution deadline?

Answer: No, some complaints have deadlines, but others depend on the type of problem.

Question 9: Are unresolved complaints automatically escalated to a higher level?

Answer: No, we usually have to follow up on them ourselves.

Question 10: Can customers track their complaint status online?

Answer: Not in every case. Sometimes they need to call us to ask for an update.

3. Web Form Questions and Answers

Survey Title: Smart Complaint Escalation System — User Survey

Survey Description

This survey aims to understand customers' experiences with submitting complaints, tracking their status, and receiving solutions. The responses will help identify common problems and determine the features needed in the proposed Smart Complaint Escalation System.

3.1 Open Web Form Questions

Question 1: What problems have you faced when submitting a complaint?

Sample Answer: I once had a problem with a service and was not sure where to submit my complaint. I had to contact customer service first to find out what to do.

Question 2: What difficulties have you experienced while waiting for a complaint to be resolved?

Sample Answer:

The most annoying thing is waiting without knowing what is happening. I do not mind waiting a little if the problem needs time, but I would like someone to keep me updated.

Question 3: What information would you like to receive after submitting a complaint?

Sample Answer:

I would like to know if my complaint was received, who is handling it, and how long it might take to solve the problem.

Question 4: How would you prefer to receive updates about your complaint?

Sample Answer:

Email or mobile notifications would be fine. I just want to know when something changes without having to call customer service every time.

Question 5: What features would make a complaint management system more useful to you?

Sample Answer:

It should be easy to use, let me follow my complaint, and send me updates. I would also like to upload pictures or documents if they help explain the problem.

3.2 Closed Web Form Questions

Question 6: Have you ever submitted a complaint to a company or organization?

Sample Answer: Yes.

Question 7: Have you experienced delays in resolving a complaint?

Sample Answer: Yes.

Question 8: Were you able to track the status of your complaint?

Sample Answer: No, I had to contact customer service to ask about it.

Question 9: Would you like to receive automatic notifications about complaint updates?

Sample Answer: Yes, that would make things easier.

Question 10: Which feature is most important to you in a complaint management system?

Sample Answer: Complaint status tracking, because I want to know what is happening after I submit a complaint.

4. Report

4.1 Interview Opinion

The interviewee explained that handling complaints can be difficult when several cases arrive at the same time. Some complaints require communication between different departments, which can delay the process.

The interviewee believes that a centralized system with automatic reminders and clear complaint statuses would make daily work easier. The system could also help employees identify delayed complaints and make sure they receive the necessary attention.

4.2 Interview Feelings

The interviewee feels frustrated when it is difficult to follow up on complaints or provide customers with clear answers. Customers may also feel ignored when they wait for a long time without receiving updates.

The interviewee believes that automatic notifications and escalation would help reduce this frustration and make the complaint handling process easier for both employees and customers.

4.3 Current State of the System

Currently, organizations may receive complaints through phone calls, emails, websites, or direct communication with customer service.

Employees record complaints and forward them to the responsible departments. However, some follow-up activities are performed manually, and complaint information may be stored in different places.

As a result, employees may have difficulty tracking complaints, identifying delayed cases, and knowing when a complaint needs to be escalated. Customers may also need to contact the organization several times to ask about the status of their complaints.

The main problems in the current process include:

1. Delays in resolving complaints.
2. Difficulty tracking complaint status.
3. Lack of clear communication between departments.
4. Dependence on manual follow-up.
5. Delayed escalation of unresolved complaints.
6. Limited visibility for customers.
7. Difficulty preparing accurate complaint reports.

These problems can affect customer satisfaction and make complaint management less efficient.

4.4 System Goals

The main goal of the Smart Complaint Escalation System is to make complaint management easier, faster, and more organized.

The system aims to achieve the following goals:

1. Allow customers to submit complaints through a centralized platform.
2. Generate a unique reference number for every complaint.

3. Categorize complaints and assign them to the appropriate department.

4. Allow customers to track the status of their complaints.

5. Set deadlines according to complaint type and priority.

6. Automatically escalate unresolved complaints when predefined conditions are met.

7. Send notifications when complaint statuses change.

8. Notify supervisors when complaints exceed their deadlines.

9. Maintain complaint records and a history of actions taken.

10. Generate reports about complaint volumes, resolution times, and recurring problems.

11. Improve communication between employees and departments.

12. Increase accountability and customer satisfaction.

5. Conclusion

The analysis shows that complaint management can become difficult when the process depends on manual follow-up and communication between different departments. Delays and unclear updates can affect both employees and customers.

The proposed Smart Complaint Escalation System aims to solve these problems by organizing complaint records, assigning responsibilities, tracking deadlines, sending notifications, and escalating unresolved complaints when necessary.

By introducing these features, the organization can manage complaints more efficiently, improve response times, and provide customers with a clearer and more reliable complaint handling experience.
